The Salesdam Insurance Module

A Full User Story: from setting up a product to paying a claim, told in plain language with real screens from the running app.

This isn't a mock-up. Every screen in this guide was captured by actually clicking through the live Salesdam app, and every record (the product, the policy, the claim) is real data that now exists in the database. We follow one story from beginning to end: Lindiwe, an insurance admin, sets up a funeral cover product; Thabo, a customer, applies for it, gets covered, and later needs to claim.

No insurance background needed: every term is explained in a shaded box the first time it comes up.

In this guide

- 1. Setting up a Product: the thing being sold
- 2. Defining a Product Version: the rules for right now
- 3. Setting the price: Benefit Covers
- 4. A customer applies: Thabo's application
- 5. Issuing the policy: cover goes live
- 6. Life happens: a missed payment
- 7. Thabo claims: from report to payout
- 8. What's a screen today, and what's still API-only
- 9. Glossary: every insurance term used, in one line

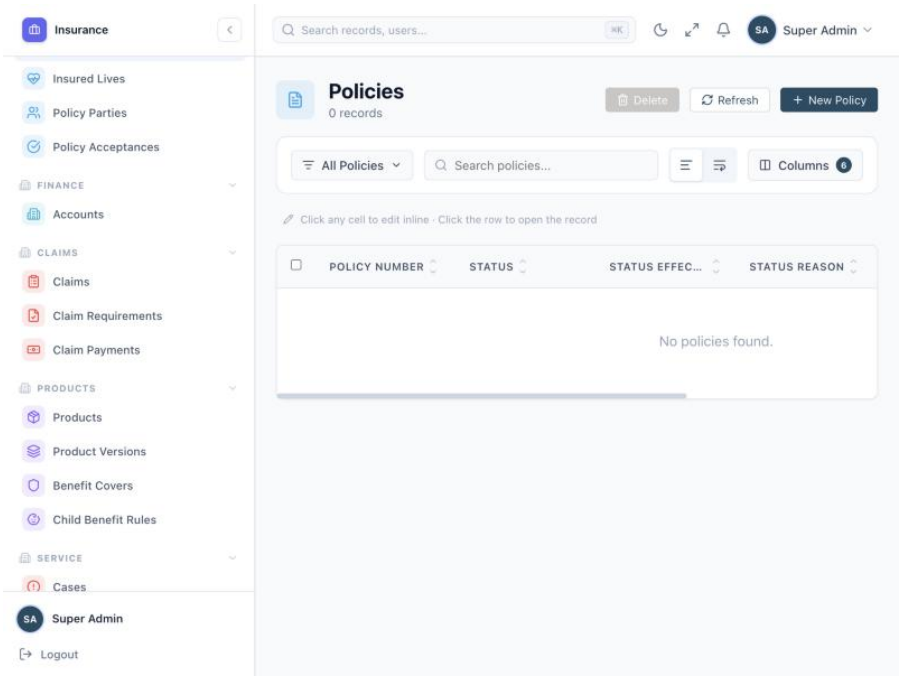

CHAPTER 1

Setting Up a Product

Lindiwe is an insurance admin at Salesdam. Her company wants to sell a funeral cover plan, so the first thing she needs is a Product, the thing being sold.

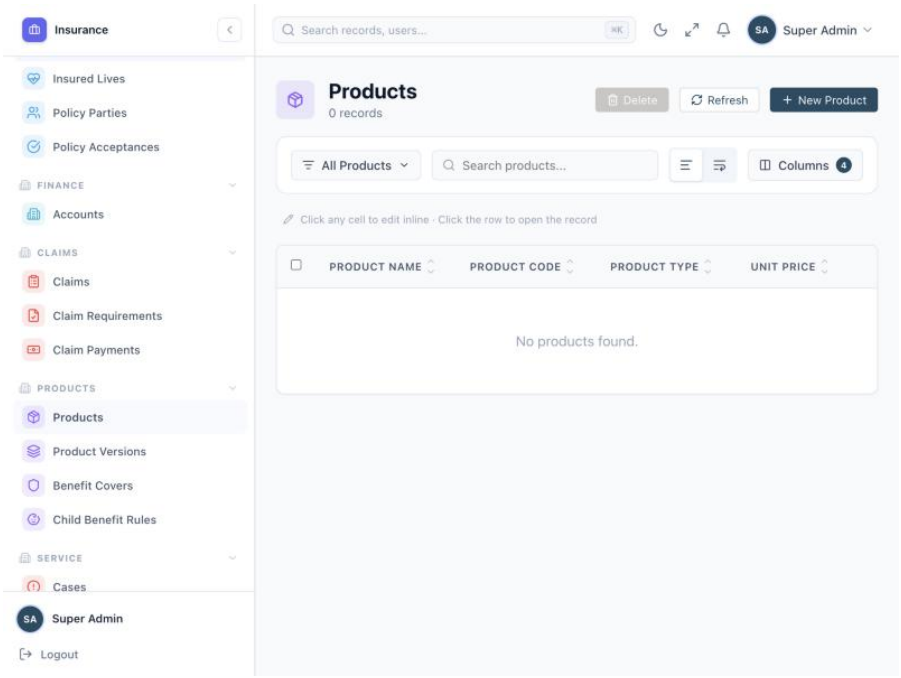

What's a Product? Think of it as the name on the brochure: “Family Funeral Plan.” It doesn't yet say how much it costs or who can buy it; that comes next. A Product is the same kind of record used elsewhere in Salesdam for ordinary sales products, reused here for insurance.

She opens the Insurance workspace. Every insurance object she needs (Policies, Claims, Products) is right there in the sidebar.

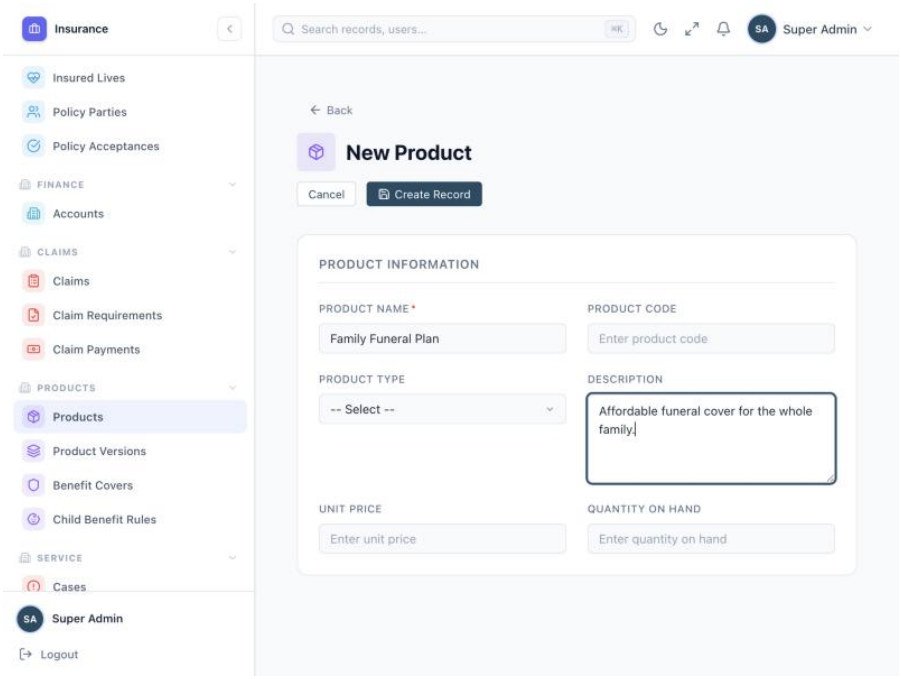

The Insurance workspace sidebar: Sales, Customers, Policies, Finance, Claims, Products, Service.

She clicks into Products, which is empty; nothing has been created yet.

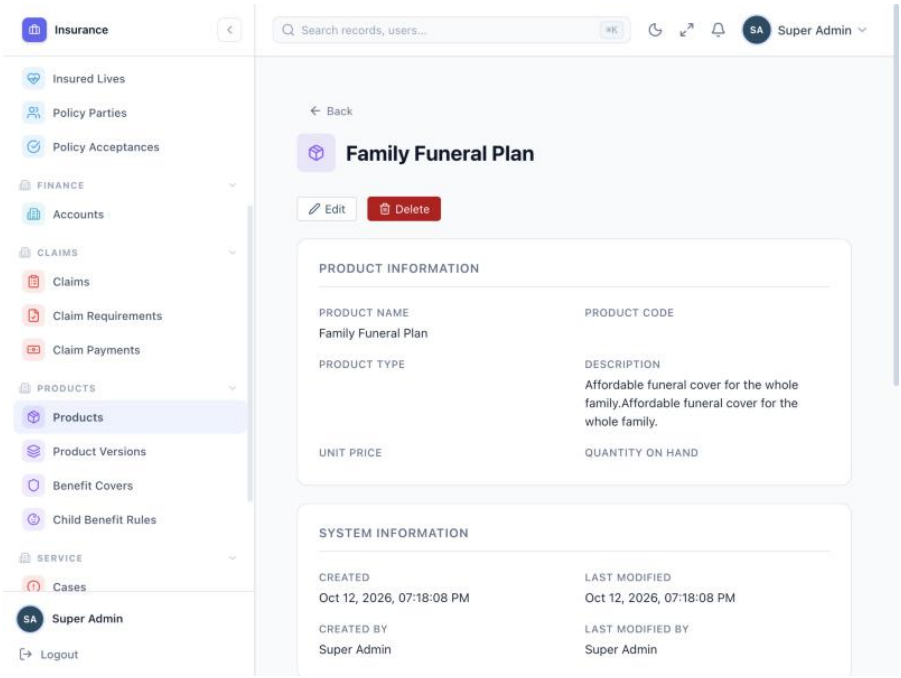

Products list, 0 records, a clean start.

She clicks “New Product” and fills in the name and a short description.

Creating the “Family Funeral Plan” product.

Saved. The product now exists as a real record, with its own detail page.

The saved Product record.

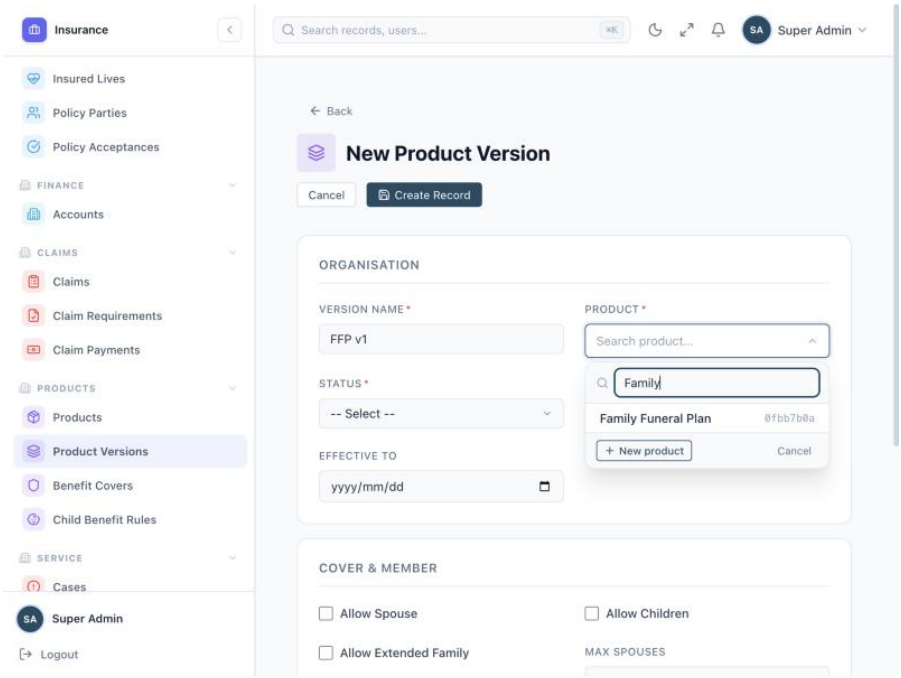

CHAPTER 2

Defining a Product Version: the Rules for Right Now

A Product alone doesn't say anything about who can join or whether approval is needed. That detail lives in a separate record, because insurance rules change over time and each version needs to be pinned to a date range.

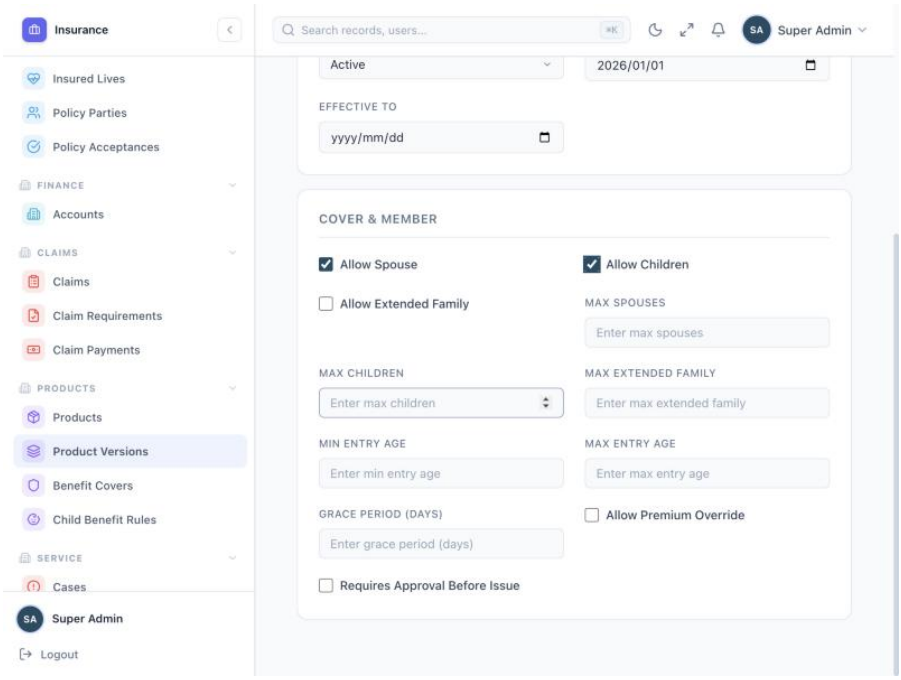

What's a Product Version? The specific rule set in force from a given date: minimum/maximum age to join, whether a spouse or children can be added, how many days' grace before a missed payment matters, and whether a human has to approve an application before it's issued. A Product can have several Versions over its life (v1, v2, …) as rules change, but a Policy is always issued against exactly one Version.

Lindiwe creates a new Product Version and links it to the Family Funeral Plan product by searching for it.

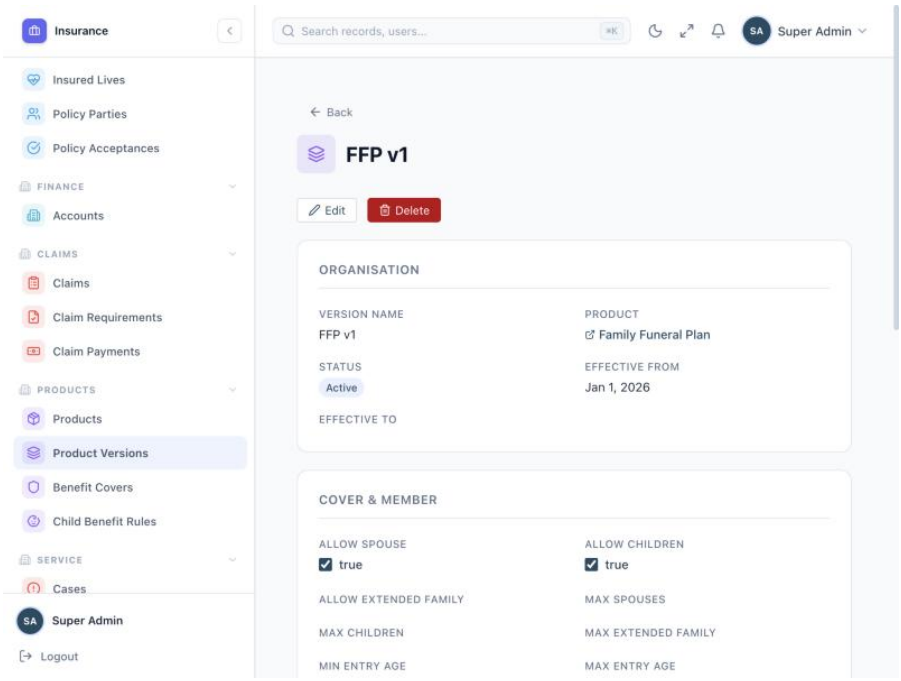

Searching for and linking the parent Product.

Then she sets the actual rules: spouses and children allowed, ages 18 to 65, and, importantly, she leaves “Requires Approval Before Issue” unchecked, so a straightforward application can go straight through without a manual sign-off.

Cover & Member rules, including the approval toggle.

Saved: “FFP v1,” active from 1 January 2026.

The saved Product Version.

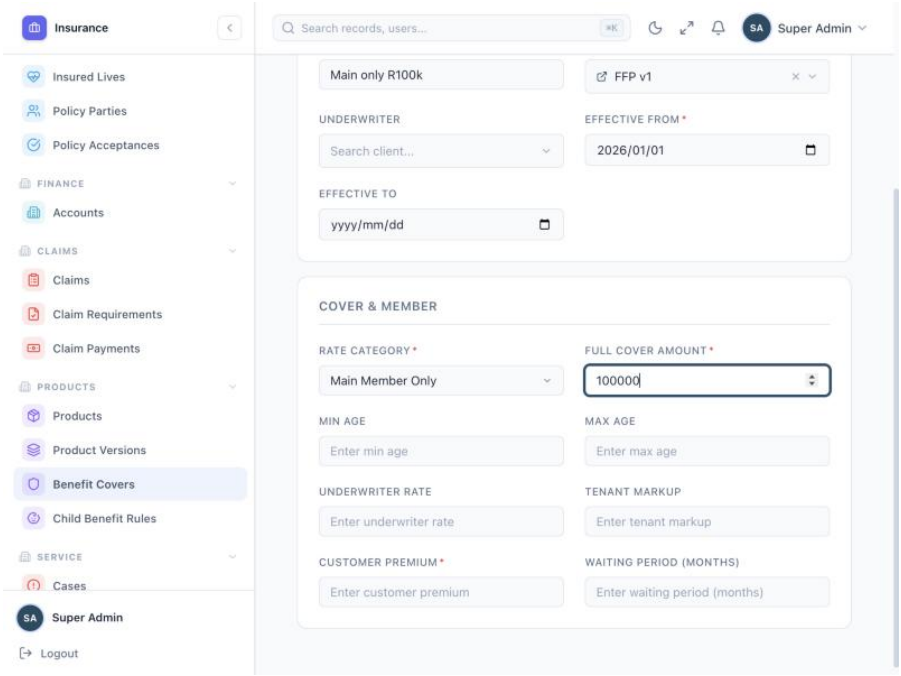

CHAPTER 3

Setting the Price: Benefit Covers

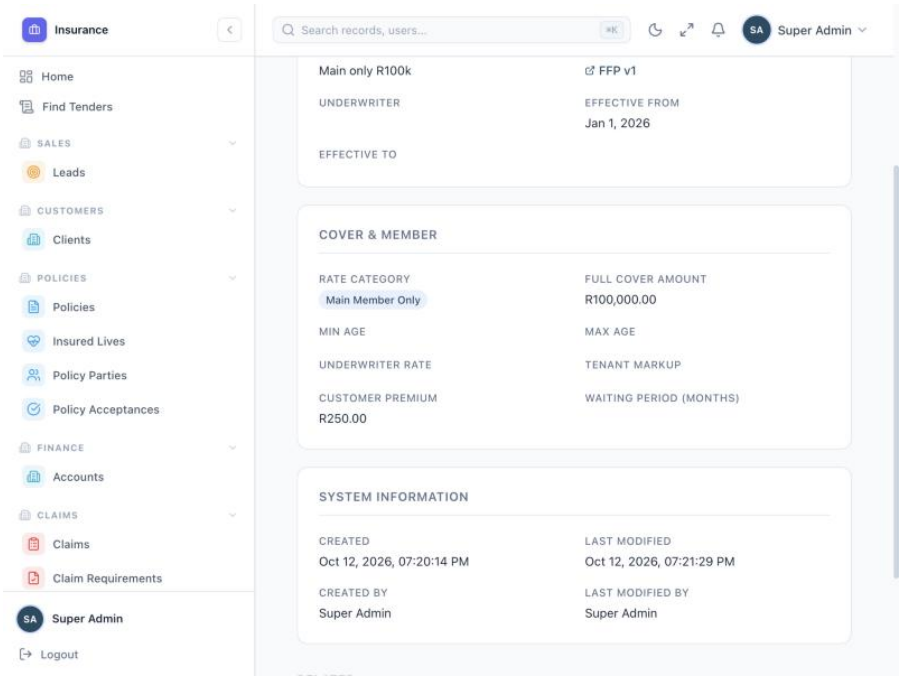

Now Lindiwe needs to say what it actually costs. That's a third, separate record, because the price depends on who's covered (just the main member? plus a spouse? plus children?) and how much cover they want.

What's a Benefit Cover? One row on the rate card: for this Product Version, this category of member (e.g. “main member only”), this cover amount (the payout if something happens) costs this much premium (the regular amount the customer pays). A single Product Version can have many Benefit Covers, one per age band, cover amount, and member category.

She adds one rate: Main Member Only, R100,000 cover, for R250 a month.

Setting the rate category, cover amount, and premium.

The saved Benefit Cover, the rate card is now live.

The product is fully configured: a Product, a Version with its rules, and a priced Benefit Cover. It's ready to be sold.

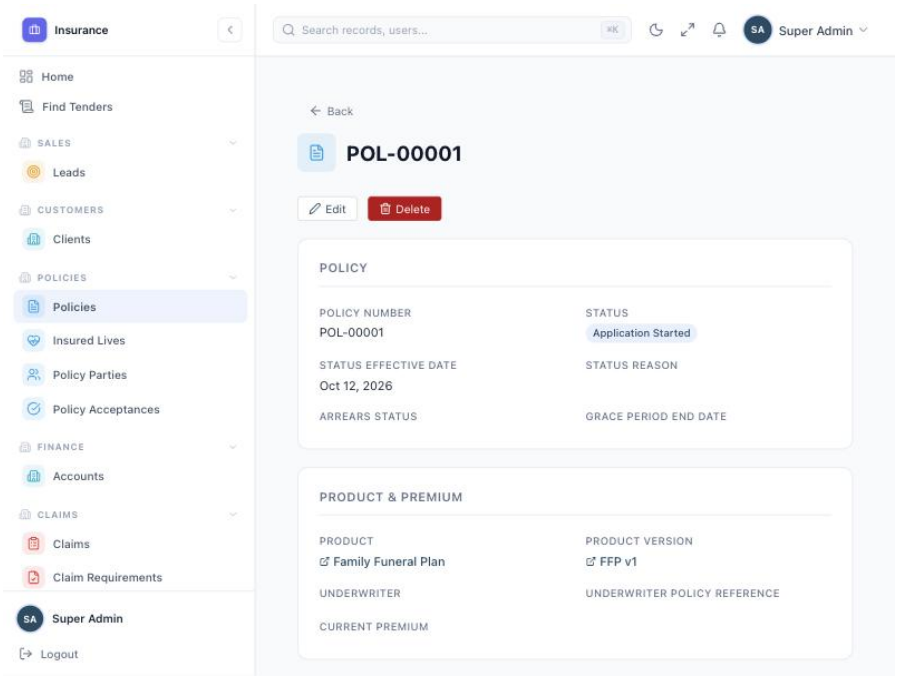

CHAPTER 4

A Customer Applies: Thabo's Application

Thabo Nkosi wants to buy funeral cover for himself. In a finished product this would be a form on a website or an agent's screen. In Salesdam today, that specific flow (applying, getting priced, accepting terms, submitting) doesn't have its own clickable screen yet. It runs correctly behind the scenes (through the same engine a website would eventually call), and what it produces is a completely real, ordinary Policy record you can open and look at like any other.

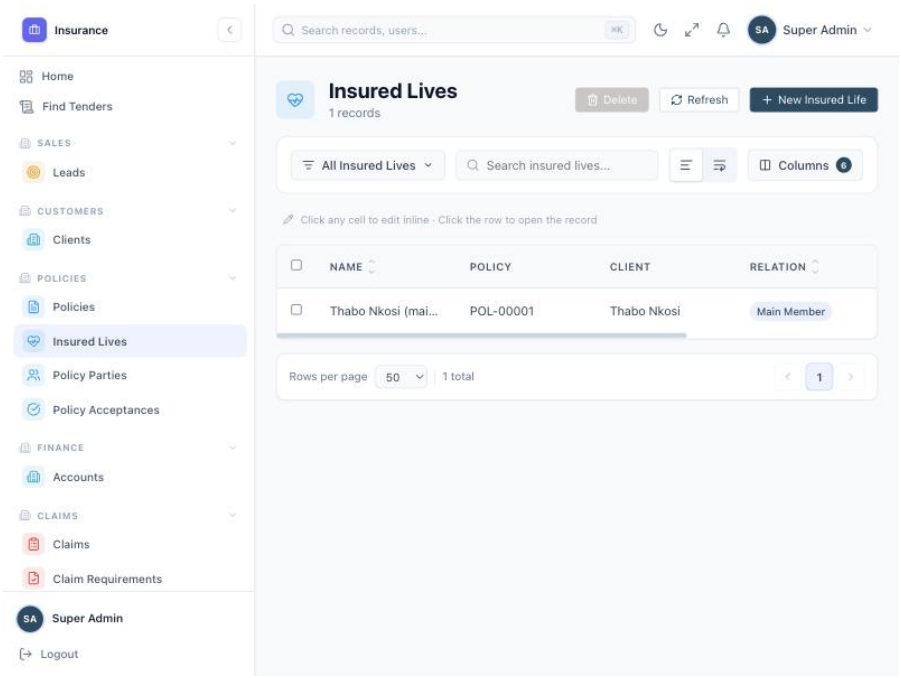

What's a Policy? The actual contract with the customer: one record per person who signs up, with its own auto-generated number (POL-00001, POL-00002, …), its own status (Application Started □ Submitted □ Active …), and its own price.

The application starts. Salesdam immediately creates a real Policy record, numbered POL-00001, status “Application Started.”

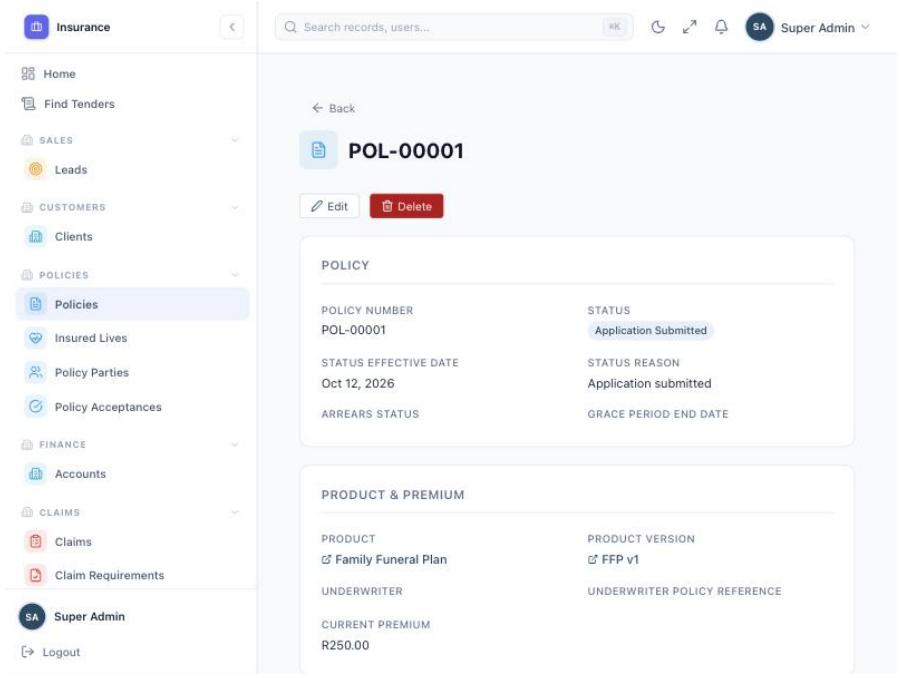

POL-00001 the moment the application begins, already linked to the right product and version.

Thabo's details are captured as the main member. Behind the scenes, Salesdam automatically finds-or-creates him as a Client, and creates an “Insured Life” record: the person actually covered, with their age and cover amount.

Thabo Nkosi now appears as an Insured Life on POL-00001.

He's also captured as the premium payer, accepts the terms, and submits. At that moment the pricing engine reads the Benefit Cover rate card we set up in Chapter 3 and calculates his premium automatically: R250, exactly matching the rate.

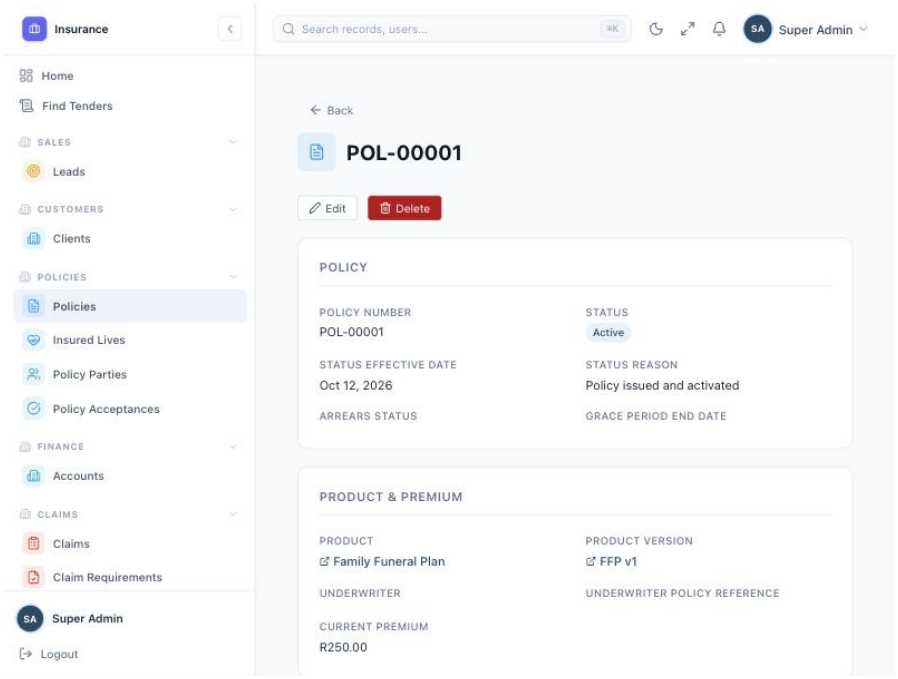

Application Submitted, premium correctly priced at R250.00, computed by the engine, not typed in by hand.

CHAPTER 5

Issuing the Policy: Cover Goes Live

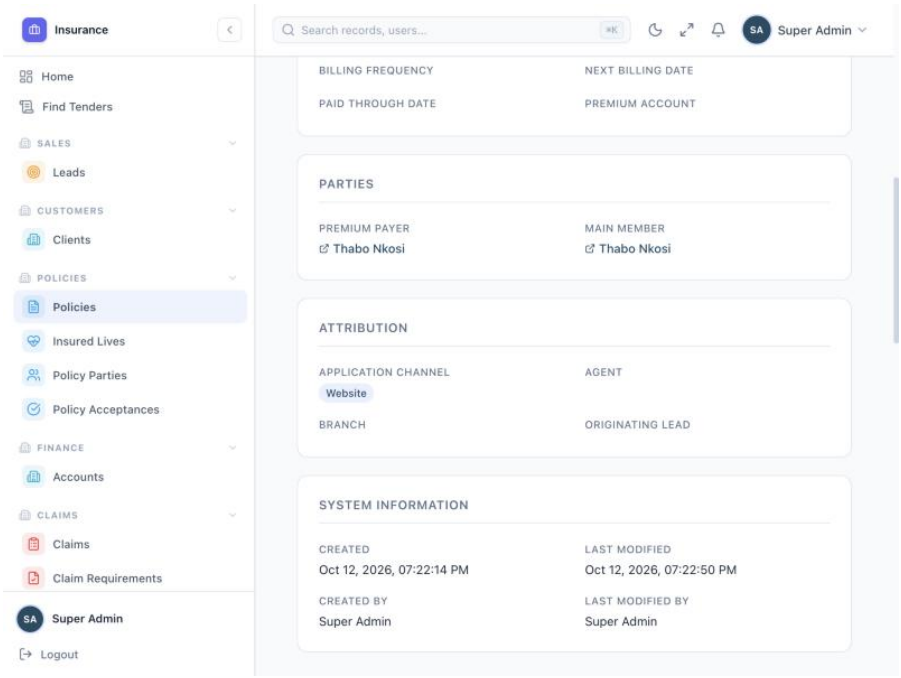

Because this product doesn't require approval (Chapter 2), the policy can be issued straight away. “Issuing” is the moment cover actually starts.

What happens on issue? The policy's status flips to Active, and Salesdam automatically generates two documents behind the scenes (a contract and a policy schedule) and stores them against the policy. No separate step needed.

POL-00001 is now Active.

The Parties section shows both roles Thabo holds on this policy: he's both the Main Member (the person covered) and the Premium Payer (the person who pays).

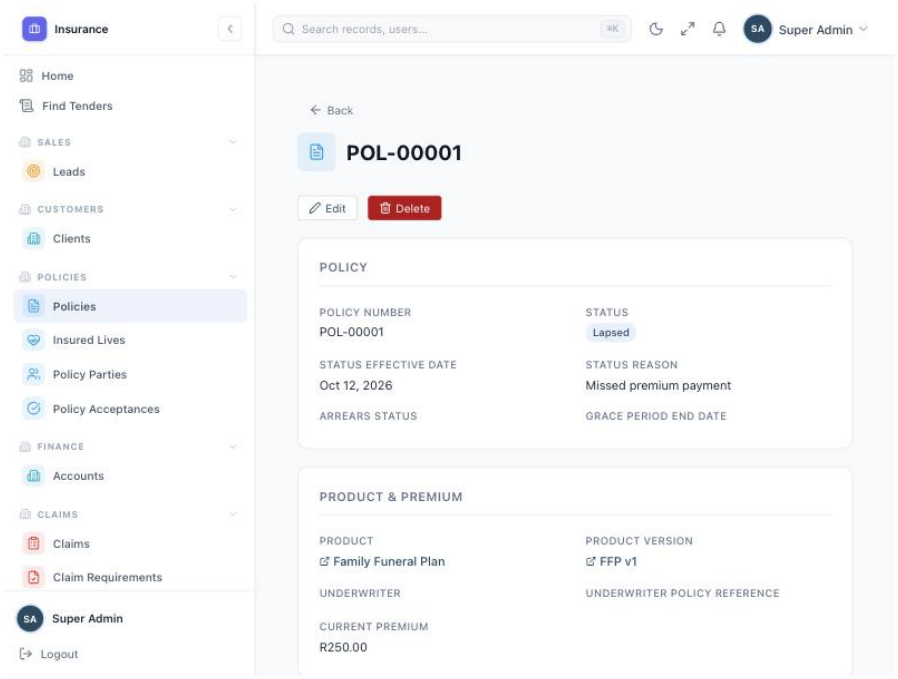

Premium Payer and Main Member, both Thabo Nkosi.

CHAPTER 6

Life Happens: a Missed Payment

A few months later, Thabo misses a premium payment. An admin (or, eventually, an automated billing job) lapses the policy.

Lapse / Reinstate: Lapsing suspends cover without cancelling the contract outright; it's the standard response to a missed payment. Reinstating brings it back to Active once the customer pays up. Every status change like this is permanently recorded, so there's always a full history of what happened and when.

One click (one API call) and the status badge updates immediately, with the reason recorded.

Thabo pays what he owes, and the policy is reinstated back to Active, the same real-time status change, in reverse.

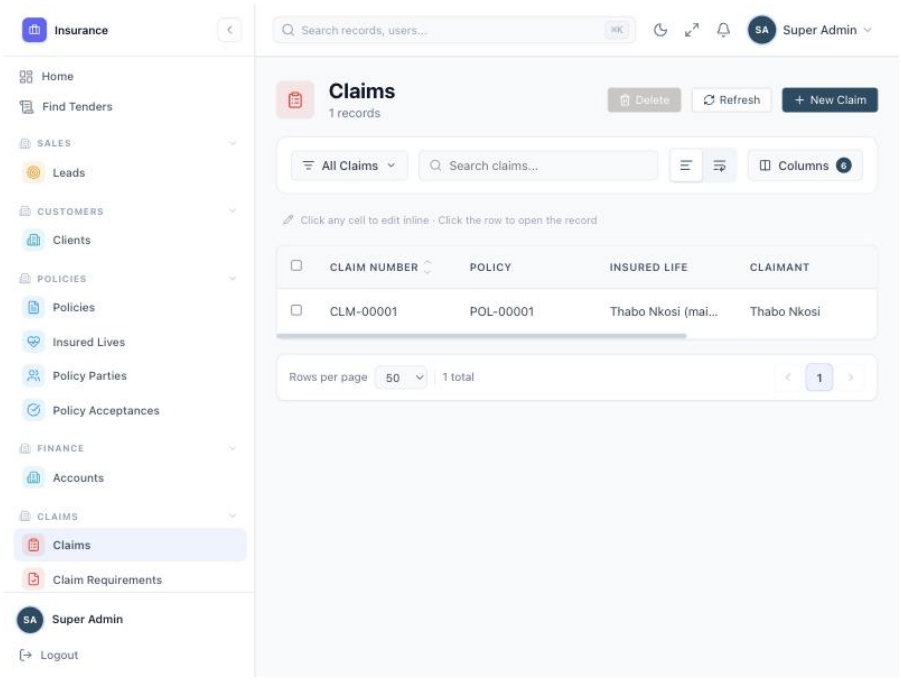

CHAPTER 7

Thabo Claims: From Report to Payout

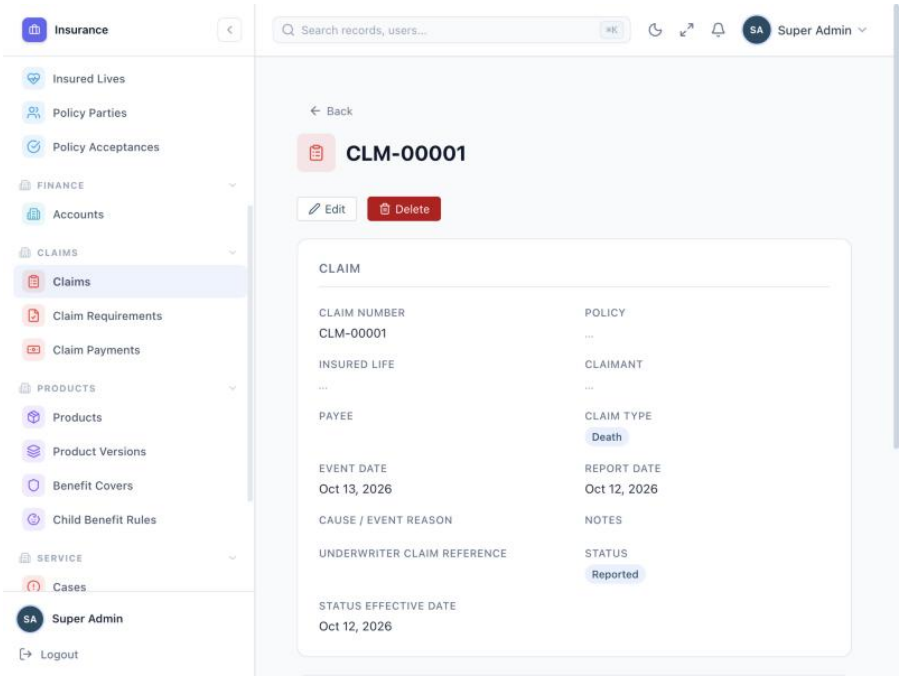

Sadly, Thabo later passes away and his family claims on the policy.

What's a Claim? A separate record, linked to the Policy and to the specific Insured Life being claimed for, that tracks a payout request from report through to payment: Reported □ Under Review □ Approved □ Paid (or Declined at any point before approval). Salesdam enforces this order; you can't jump straight from Reported to Paid, and you can't approve a claim with amount of zero or less, or mark one Paid without first recording an actual payment.

The claim is filed: a death claim, event dated the day after cover started (Salesdam correctly refuses a claim dated before cover began, try it with an earlier date and it's rejected). It's auto-numbered CLM-00001.

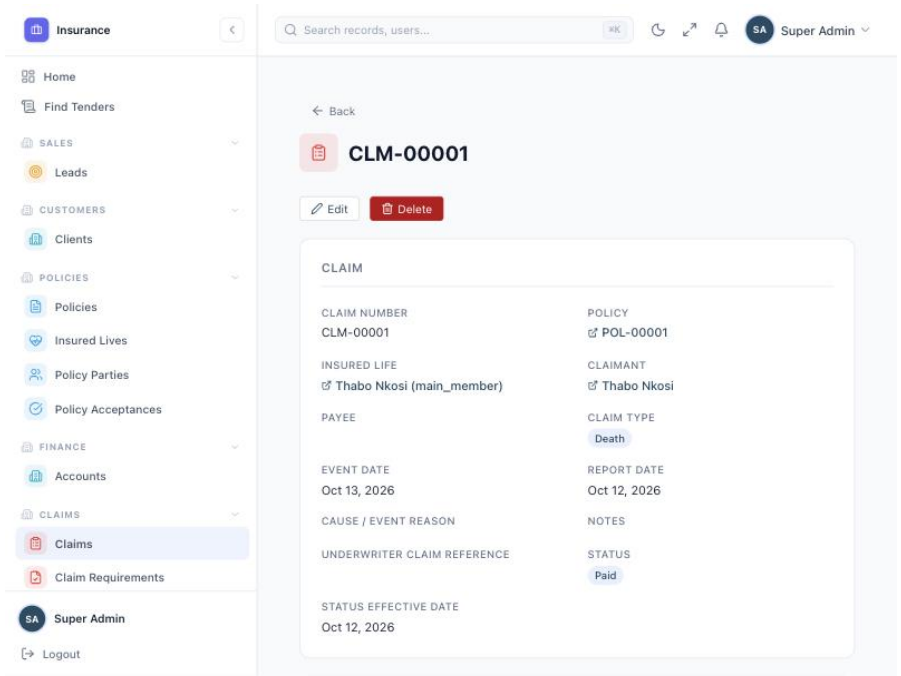

CLM-00001 appears in the Claims list, already cross-linked to POL-00001 and Thabo Nkosi.

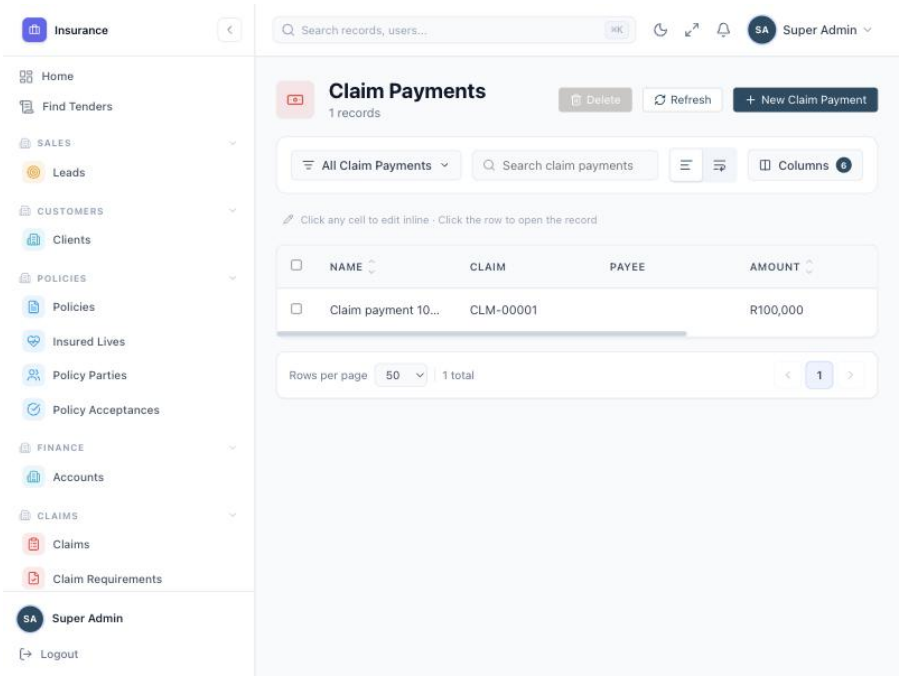

The claim detail screen, status “Reported.”

The claim is reviewed and approved for the full R100,000 sum assured, then a payment is recorded, which automatically moves the claim to Paid.

CLM-00001, status Paid.

The R100,000 payment record, linked back to the claim.

That's the full lifecycle: a product was built, priced, sold, serviced through a missed payment, and paid out on a claim, with every step leaving a real, auditable record.

CHAPTER 8

What's a Screen Today, and What's Still API-Only

Everything in Chapters 1 to 3 and everything you *saw* in Chapters 4 to 7 is a genuine screen in the live app: you can click “New Product,” fill in a form, and save it exactly as shown. The one gap: the specific sequence that turns a raw application into a priced, issued policy (apply □ capture member □ capture payer □ accept terms □ submit □ issue) doesn't have its own guided screen yet. It's a series of API calls today (what this walkthrough used to create POL-00001), the same way a website's sign-up form would eventually call them.

Everything that comes *after* that point (viewing the policy, lapsing/reinstating it, filing and progressing a claim) is fully clickable, exactly as shown above.

Update: at first, only the superadmin test account could see these screens, because the standard user role hadn't been granted permission on the new insurance objects. That has since been fixed: the standard_user role now has full access too, so a regular agent account (such as the seeded insuranceuser account) sees and uses these screens just the same.

CHAPTER 9

Glossary: Every Term Used, in One Line

Product

The thing being sold, by name, e.g. “Family Funeral Plan.” Doesn't say price or rules.

Product Version

The specific rule set for a Product from a given date: who can join, ages allowed, whether approval is required before issue.

Benefit Cover

One row on the rate card: a cover amount and premium for a given member category under a Product Version.

Policy

The actual contract with one customer. Auto-numbered (POL-00001…), has its own status and price.

Insured Life

The specific person covered by a policy, with their age and cover amount; not always the same person as who pays.

Policy Party

A role someone plays on a policy: Main Member, Premium Payer, etc. One person can hold more than one role.

Application

The process of turning a raw request into a priced, issued Policy: start, capture member/payer, accept terms, submit, issue.

Premium

The amount the customer pays regularly for their cover, calculated automatically from the Benefit Cover rate card.

Issue

The moment a submitted application becomes an active policy; documents are generated automatically.

Lapse / Reinstate

Suspending cover (e.g. for a missed payment) and later restoring it, without cancelling the contract.

Endorsement

A tracked amendment to an active policy (e.g. a cover-amount change) that goes through its own approve/apply flow.

Claim

A payout request against a policy, linked to the specific Insured Life, tracked Reported □ Under Review □ Approved □ Paid.

Claim Requirement

A document or condition that must be cleared before a claim can be approved (not used in this walkthrough, but part of the engine).

Approval

An optional gate: if a Product Version requires it, a submitted application can't be issued until a human approves it.
